# Movies Search Engine and Recommender System

Nassim Habbash 808292 Ricardo Matamoros 807450 Giacomo Villa 807462

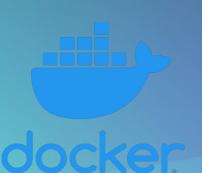

- Tools and Data
- Search Engine
- Recommender System
  - Personalized search recommendations
  - Content-based
  - Neural collaborative filtering
- Conclusions
- System demo

#### Libraries/Languages/Tools used:

- ElasticSearch+Kibana (Search Engine)
- Keras (Recommender System)
- Django (ORM/Web Framework)
- Python (Programming language)

### The dataset is MovieLens with approximately 45'000 movies textual information

- Title
- Overview
- Original Language
- Spoken Language
- Genres
- ..

The MovieLens data also contains about 270'000 user ratings on a scale from 1-5 obtained from the GroupLens website.

### The user dataset contains 10 different profiles:

- Username
- Genres Preference
- Languages
- Film ratings
- ..

Two different kinds of **user representations** have been formed for the Search Engine and the Recommender System

### Search Engine

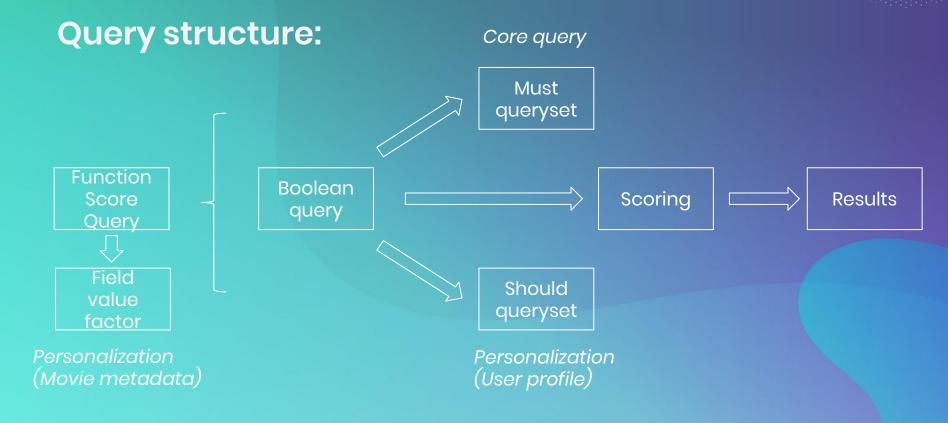

#### **Defined analyzers:**

- Standard
- No-stem

### Analyzers specifications:

- Standard tokenizer, lowercase token filters, stopwords removal, Snowball stemmer
- Standard tokenizer, lowercase token filters, stopwords removal

### **Query parameters:**

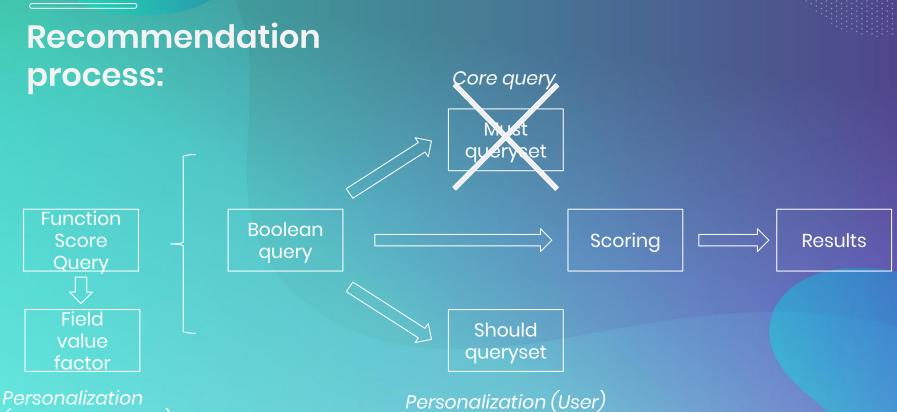

- Personalized: based on user profile, using should queryset
- Fuzzy: allows inexact fuzzy matching
- Synonyms: creates multi-terms synonyms expansion
- Popularity: based on movie metadata, using function score query
- Weighted vote: based on movie metadata, using function score query
- Phrasal: allows exact search

### Recommender Systems

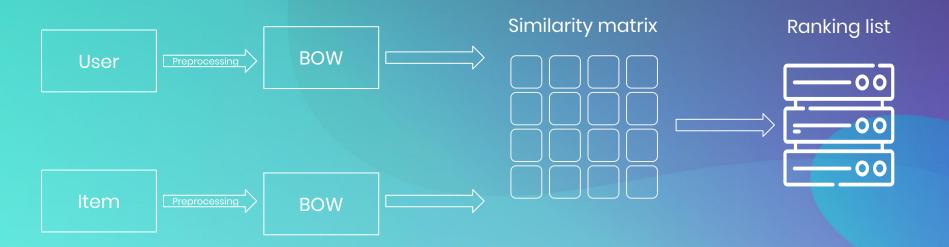

(Movie metadata)

#### PERSONALIZED SEARCH RECOMMENDATIONS

### Recommendation process:

### COLLABORATIVE FILTERING

We used deep learning to predict the missing ratings.

- Consider the URM matrix

Test set

Train set

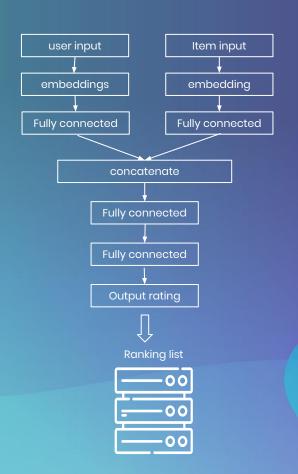

Neural Network

### COLLABORATIVE FILTERING

Get the trained model (NN-FF), it is used to predict the ratings of films not yet seen by a user.

#### Advantages:

- CB provides independence by users
- CB provides transparency by unknown users
- CB avoids cold start
- CF improves with increasing data
- CF is well suited to differents domains
- CF improves serendipity

#### Disadvantages:

- CB has problems of scalability with big datasets.
- CB has problems with filter bubbles.
- CF has problems with unbalanced datasets.
- CF with DL requires to retrain NN for new users and new items.

- Additional relevance dimensions (Search Engine)
- Formal performance measures
- Custom similarities and mappings in Elasticsearch (Search Engine)
- Denser items and users representations (Recommender System)
- Recommender hybridization (Recommender System)

## Thanks for the attention 🗎
